

Come fix the heart with us in the big apple.

The Zangi lab is recruiting.

The Zangi lab is the newest addition to the Cardiovascular Research Center at the Icahn School of Medicine at Mount Sinai located in Manhattan, New York.

Our lab focuses on cardiac regeneration and on the role of adult cardiac stem cells in the healthy and injured heart.

Our main goal is to unravel paracrine signals that can enhance cardiac regeneration after injury. Therefore, we are using modified mRNA as a novel gene delivery tool to locally up-regulate or down-regulate paracrine factors after myocardial infarction in small and large animal models.

We are now recruiting Post-docs to our group.

The ideal candidates will have a strong track record in at least one of the following fields: stem cells, heart failure, virology, immunology and tissue engineering. Applicants with molecular biology and tissue culture skills will be preferred.

The starting date is flexible. Applications will be accepted until the positions are filled.

Interested applicants should send a CV, a brief description of research interests, and contact information for up to three references to: lior.zangi@mssm.edu
Informal inquiries are welcome.

We offer competitive packages.
